SIT120 Task 2.1C – ToDo App

I made this app a few weeks ago and spent a decent amount of time messing around trying to get things working. After completing more of the course content and learning better ways of completing the task, I'm not super happy with this app. It does the job though and shows the level I am/was at when I made it though. I would like to make the todo list a separate component which I can send either the todo or done list elements to and have it create the list of items to show. I might go back and complete it one day.

I used the v-model to get the data from the form into the todo object, then I used v-for and v-if to display different elements of the object depending on user selection. I used @click to get the functions working and @click.stop to prevent clicks on child element buttons from triggering the parent section actions.

Empty todo list

Adding tasks to the list

Your ToDo List

ToDo List	Cancel todo

Name: First Task
Description: make a first task
Date: 09 / 28 / 2023

Add Item

Task marked urgent and one showing details
